

Demixter SOS System;

Demixter SOS System allows companies and organizations to communicate with their personnel via SMS.

Name, Surname, Phone Number and required information of the personnel can be transferred to the Demixter SOS database with an API integration. With this API connection provided, personnel information in the database can be updated, so that changes in personnel records are synchronized.

“Send Location” SMS messages can be sent to all users in the Address Book. This message contains a link to a web page that opens when users click on it. When you click the link, it sees its current location on the map on the page that opens, and then clicks the SEND button and introduces its first location to the system.

As each user sends their location, users begin to appear on the given location on the map in the Administration Panel.

In this way, in case of a possible disaster, information can be made according to the marked location of the people. While location information can be obtained instantly from smartphones with an Internet connection, SMS messages sent by users who do not have an Internet connection or smartphone are forwarded to authorized persons via SMS.

Templates can be created with parametric address book fields. Different message texts will be needed for each emergency such as earthquake, flood, fire etc. Template messages created in the event of a disaster can be sent to the recipients via the admin panel, or messages can be triggered by SMS sent to the SOS system by users who have been authorized beforehand. An example SMS content for the message to be sent could be as follows:

Dear Ahmet, according to your latest location notification on 22/March/2022, an earthquake occurred in your area. If you need help right now, please reply to this message with YES.

Functions

Address book

- Manual receiver operations
- Recipient update from file
- Receiver update via API
- Query the current location of the recipients
- Recipient grouping
- Recipients display on the map

Messages

- Communication via SMS and Email
- Message templates
- Message sending
- Message collection

Incoming response grouping

Reply to incoming messages with template or free text

Settings

- Administrator definitions
- Company SMS, Email settings

Other

- ✓ Multi-language support
- ✓ Automatic notification of earthquakes occurring in the last 1 minute from AFAD and USGS (U.S. Geological Survey) databases
- ✓ Dashboard where data in the application can be followed instantly
- ✓ Database and user interface working synchronously at home and abroad against disaster scenarios
- ✓ "Simulation" interface that allows to start sending and collecting messages for data testing or practice at any time

THANKS
